Web Application Security - IBM Security AppScan, HP WebInspect and other products can

help you identify the open and vulnerable URLs in your. AppScan can scan the following version. Q: is it possible to log into an app with a bluetooth device? as suggested by apple's guidelines, I would like to have a remote control to control my phone's screen. They say that you can use a Bluetooth device for this, but how do you control the device? Now apple says:

iOS 5.0 added the ability for a developer to request that a remote control enter the user's device and connect to a private location. Now I assume that this would only be possible if the user's device is paired with the remote control. So how do I request this? I can't find any info

in the docs. A: If you only want to pair a single device, this is fairly easy to do with the CoreBluetooth framework. if ([centralManager isCentralManagerForDevice:device]) { [centralManager cancelPeripheralConnection:peripheralConnection]; [peripheralConnection cancelPeripheralConnection]; [centralManager stopScan]; } If you want to pair multiple devices, you can change your code to register for

CBCentralManagerScanOptionAllowDuplicates on the device you want to scan for, and then receive the duplicates. You can then deregister for your specific device. See here for more details:

```
import { CommonModule } from '@angular/common'; import { NgModule } from '@angular/core'; import { FormsModule } from '@angular/forms'; import { BootstrapTimepickerModule } from 'ngx-bootstrap-timepicker'; import { NbTimepickerComponent } from './timepicker.component'; import { NbTimepickerDirective } from './timepicker.directive'; @NgModule({ imports: [ CommonModule, d4474df7b8
```
