

.mat files, a compact format to describe mathematics, in the Open Source Calculus suite with additional support for .mcl files. This is a major step forward for MathML and Calculus, both in terms of being able to describe mathematics more compactly and, more importantly, in increasing the number of tools and languages that are capable of reading and writing .mat files.  In Figure , we show a side-by-side comparison of the original Calculus software and the revised model, on the right, with right-hand panel showing a one-to-one comparison of the toolbars and menus of the original model and the updated version. The new .mat files were first released in Calculus 8.1 and are now also present in the MathML compiler, MathKernel . .mat files are read by MathKernel and Calculus 8.1 to produce the new Calculus 8.1 model. These files are particularly useful for allowing calculation of inner products or contraction of tensors, and for encoding visualization. In MathKernel and Calculus 8.1, .mcl files are produced by reading and parsing the .mat files. MathKernel will read and produce .mcl files of all of the .mat files specified as Calculus inputs. In Calculus 8.1, .mcl files are produced of the inputs corresponding to the appropriate Calculus model. This allows mathematical operations to be performed in .mcl files, providing functionality similar to Matlab.  MathML has traditionally provided mathematics in .wml files. Calculus 8.1 now supports a .wml file, which supports the initial version of Calculus mathematics, and is a read-only format. MathML and Calculus are similar in that they both have a component that provides mathematics, and these components can be used separately or together.  MathKernel is a Calculus GUI that provides improved support for mathematical representations in .wml files. MathKernel includes the new .mcl files in addition to the conventional .wml files.
