When I'm in a buffer and want to switch to another, I can type C-x C-s C-s, or I can also type C-x C-s S-up. These two methods are both valid ways to switch to another buffer. However, I find that C-x C-s S-up sends the message (interrupt) for switching to another buffer when I'm typing, while C-x C-s C-s does not, so in fact, it is a bug to use C-x C-s S-up to switch to another buffer. In fact, when I go to the buffer where I'm typing, the buffer should switch to another buffer, but it doesn't.

Visual Pascal is a powerful software designed for the programming of an algorithm that requires a graphical representation and immediate visual feedback to the programmer. With just a click you can generate Pascal or Delphi source code for any algorithm, based on a graphic scheme that describes the algorithm and the execution order. The application is rather intuitive, but you should take the time to figure out what each item does before inserting them into the code. Developers who are familiar with the Delphi environment can easily use Visual Pascal by migrating existing projects. The software comes with a large number of pre-defined graphic schemes and additional dialogs for users to set and modify the syntax of a form. Visual Pascal contains several predefined graphic schemes that you can use without any limitation: Sequential, Cyclic, Loops, Recursion, Nesting, Recursive Nesting, Iterative and Inheritance. The application is not restricted to any programming language, being also capable of generating C source code, assembly language, VB scripts, and several other languages. Visual Pascal comes with various built-in options, commands and dialogs, each one allowing you to save, export, execute and modify an algorithm. The software can be easily extended by adding additional options, commands and dialogs. Visual Pascal is a powerful software that allows you to visually represent an algorithm and provides you with full control over the code generated. Its intuitive interface and smart features will ensure that you won't waste a single second of your time. Features: Intuitive user interface, allowing you to visualise the algorithm step by step. Automatic insertion of new commands. Automatic code generation. Global and local variables, properties, methods. Enumerations, arrays, records. Error detection. Workspace customization. Immediate error reporting. Automatic backup, compilation and export of files. Advanced workspace customization. Generate C, VB scripts, assembly language, XML and WML code.
