Mapping intragenic enhancers in a mammalian gene: the mouse beta-globin gene cluster. We have used various transgenic approaches to identify cis regulatory elements controlling the expression of globin genes. To begin to map functional cis elements in the mouse beta-globin gene complex, we placed 12 globin genes under the control of tissue-specific globin gene promoters, and scored for the ability of the transgenes to activate transgene expression in the presence of strong globin promoters and with diverse globin gene promoters. Using these transgenic mice, we have mapped two enhancer elements located at -97 kb (p5) and -328 kb (p9) from the human beta-globin gene. A third enhancer located at -3076 kb (p2) from the beta-globin gene was found by comparing activity of the transgenes in three different locations. United States ambassador to the United Nations Nikki Haley on Friday said the US is prepared to veto a resolution on Yemen against Saudi Arabia, warning the resolution would lead to an "eternal war." Haley's comments came after the UN Security Council failed to agree on a resolution on Yemen, adopted last week by a vote of 12-0. The resolution, initiated by Yemen, seeks to condemn the aerial campaign that Saudi Arabia has been waging in Yemen's neighbor, Yemen, for nearly two years. The UN resolution, which calls for the dismantling of the air campaign and an end to aid violations, would have enabled the UN to help with the alleged violations, and would have allowed Yemen to seek emergency humanitarian assistance. Haley stated that the US was ready to veto the resolution when it came before the UN Security Council. "We are not going to let up on this. This is not the United States' fight in Yemen. It's not America's fight. It's a Muslim-led fight, a Saudi-led fight. Our focus is not Yemen. Our focus is everywhere. This is not just about Yemen. This is about there being a group of countries who can never allow their people to decide their future and are always willing to take whatever action they want in order to change it," Haley told reporters at the UN headquarters. The US ambassador also criticized the latest resolution which supports a political settlement in Yemen, and opposed the idea that the UN Security Council has the sole right to decide about a member's

What's New in the Adobe Photoshop CC 2015 Version 17?

This invention relates to methods and apparatus for treating fluids, and more particularly, to methods and apparatus for treating fluids in which solid materials are removed from the fluid. All fossil fuels eventually become depleted. Even the most fossil fuel rich regions of the world are presently mined to the extent that they are no longer economical to mine or transport to market. What is needed is an economical process for increasing the supply of fossil fuels, especially in regions which are rich in fossil fuels. Bio-methanation is the biological conversion of renewable, normally solid, biodegradable organic materials, such as agricultural residues, animal manure and municipal solid wastes, to produce methane gas. The process requires the presence of microorganisms and the reaction to be carried out at a sufficiently elevated temperature for sufficient time for the microorganisms to utilize the biodegradable feed materials, thereby converting them to products that can be further degraded, such as methane gas. The volatile gases are released into the atmosphere without being a pollutant to the atmosphere, unlike fossil fuels. This invention relates to apparatus for anaerobically treating a fluid, particularly a fluid in which solid materials are suspended. The solid materials are removed from the fluid during the treatment of the fluid in a stage such as a settling stage. The apparatus comprises a vessel that defines a treatment chamber, and a conduit that conducts the fluid into the vessel and removes the fluid from the vessel. The apparatus is operated so that solid materials from the fluid contained in the chamber are removed. This invention relates to apparatus for anaerobically treating a fluid, particularly a fluid in which solid materials are suspended. The solid materials are removed from the fluid during the treatment of the fluid in a stage such as a settling stage. The apparatus comprises a vessel that defines a treatment chamber, and a conduit that conducts the fluid into the vessel and removes the fluid from the vessel. The apparatus is operated so that solid materials from the fluid contained in the chamber are removed. A portion of the apparatus is submerged in the fluid, and an upwardly facing portion of the vessel walls defines an annular space that surrounds the submerged portion of the apparatus. A baffle is positioned in the annular space, and extends laterally outwardly from the apparatus. When the fluid moves through the conduit, it pushes the baffle upwardly. The upwardly directed fluid force causes the baffle to rotate, which in turn causes the particles of solid materials to be removed from the fluid by the upwardly directed force of the fluid. This
